

CRAIG WEBB
Consultant Arborist

*WDC PLAN CHANGE 2
STEM ASSESSMENT OF PROTECTED TREES*

WAIPA DISTRICT COUNCIL

REPORT PREPARED BY: CRAIG WEBB

DATE: 26 OCTOBER 2018

EXECUTIVE SUMMARY

STEM evaluation of all existing protected trees has been carried out to assist with determining which trees may qualify for protection under the Waipa District Plan following Plan Change 2.

On the basis of a threshold of 120 points being applied, 78 of the 119 trees (66%) assessed would meet the threshold required to be included in the list of protected trees. Thirty (30) of the 78 trees (38%) would meet the proposed higher threshold of 138 points, which would require mandatory public notification of any application to remove the tree.

On the basis of a threshold of 120 points being applied, 41 of the 119 trees (34%) assessed would not meet the threshold required to be included in the list of protected trees.

1 INTRODUCTION

- 1.1 I, Craig Webb Consultant Arborist (CWCA Limited), have been commissioned by Waipa District Council (WDC) to provide a review of the proposed Plan Change 2 – Protected Trees. Further to initial assessments of the proposed plan change and preliminary assessments of 11 trees, I have been engaged to provide an assessment of all currently protected trees to allow a revised schedule of protected trees to be notified as part of the Plan Change process.
- 1.2 The purpose of this report is to provide my findings of a review of the current list of protected trees using the Standard Tree Evaluation Method (STEM), which is proposed to be adopted as part of Plan Change 2.
- 1.3 The assessment of the existing protected trees was carried out during site visits on 25-26 September and 3-4 October 2018.
- 1.4 This report has been compiled with reference to the Standard Tree Evaluation Method (STEM) publication. This method has been followed to evaluate a total of 119 trees. This includes 14 trees evaluated as part of 'testing' that was carried out previously and the 105 remaining trees on the list of protected trees that currently exists in the Waipa District Plan.
- 1.5 Score sheets for each tree are provided in a supplementary document. A summary table is provided in Appendix A of this report.

QUALIFICATIONS/EXPERIENCE

- 1.6 I confirm that I am a consultant arborist with experience and qualifications suitable to provide specialist assessment and advice in relation to arboricultural matters. I hold the New Zealand Diploma in Arboriculture (with distinction) from WINTEC and I have 17 years' experience as an arborist in the regulatory and commercial sectors. I have extensive experience with, and understanding of, with various District Plans and the fundamentals of the Resource Management Act (RMA) and processing of resource consents for removal of protected trees.

SCOPE OF REPORT / METHODOLOGY

- 1.7 The scope of my engagement includes providing independent arboricultural assessment using STEM to evaluate each currently protected tree. STEM scores were compiled during the site visit using a smart-phone app designed to replicate the STEM criteria. The data was then exported to a custom spreadsheet that calculates the scores based on the merit awarded under each criterion of STEM.
- 1.8 The scoring was based on visual assessment of the trees from ground level. Private property was entered during the assessment of each tree, to allow an inspection of the trees from all possible vantage points.
- 1.9 The following assumptions and standards were applied when undertaking the STEM assessments:

-
- Evaluation of tree Form and Vigour & Vitality was based on visual signs of each trees' structural condition and canopy health at the time of assessment. The time of year for the inspection did not allow for assessment of the foliar condition of all deciduous trees, however most were 'in leaf' at the time of assessment. The time of year does not provide best opportunity to see fungal fruiting bodies, as indicators of the presence of internal decay, which may affect both ratings of Form and Vigour & Vitality.
 - Occurrence of the species is based on a list of species that has been reviewed and ratified (with some modifications) by Chris Brockelbank, WDC Arborist.
 - Tree Function (usefulness) takes into account negative factors, so that trees that may be considered a nuisance, or that provide little or no useful function score lowly in this criterion.
 - Tree Age has been ranked according to a 'best guess', based on knowledge of relative growth rates and tree size (trunk diameter). The context of the tree in relation to contemporaneous architecture has been used to guide the age estimate, for example early 1900's villas. Anecdotal comments from property owners or residents did inform some ratings under this criterion. No empirical data has been used to inform the scoring under this criterion.
 - The Stature of trees has taken the largest of either crown spread or height. Crown spread was measured in up to four radial directions and the overall crown diameter averaged. Tree height was measured using a Nikon Forestry Pro laser range finder.
 - Visibility of the trees was ranked according to a 'best-guess', based on an assessment of tree height, site position, topography and the presence, scale and number of surrounding structures and trees.
 - Each tree has been assessed as an individual, despite many trees forming part of a larger group, either formally or informally. Being part of a group may influence the overall value of environmental and amenity contributions of a tree, but these factors are not recognised during evaluation of trees as individuals.
 - Points have been awarded under the Notable Evaluation section of STEM for 10 of the 119 trees. Additional trees may qualify for local, district, regional or national significance due to size. No historical association or commemoration significance, or any other Notable Evaluation recognition is known by the author for any of the trees, except where information or anecdote has been provided. Records provided by Chris Brockelbank gave some additional information that informed the awarding of Notable Evaluation points. In other cases, points have been awarded for 'largest in District' and where exceptional size for the species was deemed worthy of awarding additional points.
 - Further review and assessment of the completed STEM assessments is required to be undertaken to confirm classifications under certain criteria and to verify the scores that have been awarded. It is necessary for the Notable Evaluation section to be evaluated further to determine if any trees qualify for additional points.

-
- 1.10 Trees were assigned a Tree Number for the purposes of the STEM assessments. These numbers differ from the original number assigned to the tree under the previous version of the list of protected trees. The tree numbers may change when the final list is published.

LIMITATIONS

- 1.11 The assessment of the trees was carried out from ground level only and involved a visual inspection of the trees. No probing, sounding, testing or detailed analysis of the tree trunk, branch structure, root plate or growing environment has been carried out to inform the evaluation process. More detailed analysis is not warranted for the purposes of a STEM evaluation, however more detailed inspection techniques may be warranted to assess the trees where significant faults in their structure exist.
- 1.12 The STEM evaluation has been carried out using conservative inputs. Where any doubt existed to the awarding of a score in any of the ten STEM criteria (under Condition Evaluation and Amenity Valuation sections) the lower value has been recorded. Further detail that is not available to me at the time of writing, particularly under the Notable Evaluation section, may result in changes to the scores awarded.
- 1.13 Trees that were assessed previously during prior engagements have not been reassessed on site. The scores of the 14 previously assessed trees have been modified during the STEM review process, where scores may have been adjusted for consistency.
- 1.14 My opinion of the protected trees, in terms of their relevant merit and detriment, when considered against the STEM criteria acknowledges the limitations of a 'one-off' assessment. No details of potentially relevant matters relating to property owners, past maintenance requests, past consent applications or political history has been, nor should be, considered during the tree evaluation process.

2 ANALYSIS

- 2.1 The table in Appendix A of this report sets out the score results of the 119 trees. Trees that have obtained a score of 120 or more points have their total score displayed in **Green**. Trees that have obtained a score of less than 120 points have their total score displayed in **Red**.
- 2.2 If Waipa District Council adopts a threshold for tree inclusion at 120 or more points, 34% (41 of 119) trees would no longer be protected by the Waipa District Plan. These trees can be considered to be poor quality trees, trees that are poorly positioned (nuisance value) or trees that have no outstanding merit. Examples of these poor-quality trees are discussed below:
- Thirteen (13) of the 27 *Quercus robur* or English oak trees assessed have scored less than 120 points. This includes trees that are in declining health and/or have questionable structural form. This species is also noted to be 'predominant', so scores poorly in the 'Occurrence' criterion.
 - Four (4) of the 6 weeping elm (*Ulmus glabra* 'Pendula') trees scored less than 120 points. These are not large trees and are not generally widely visible. The two

exceptional specimens are at 91 Coleridge Road and 60 Browning Street, Leamington, which scored well (compared to the others) for 'Visibility' and 'Form', respectively. The specimen at 60 Browning Street is also the largest of its kind (by trunk diameter) measured in the District, so has been awarded points under the Notable Evaluation.

- Other trees that are of relatively small stature that scored less than 120 points include one Japanese maple (*Acer palmatum*), dogwood (*Cornus capitata*), pepper tree (*Schinus molle*), *Camellia* 'Pilada' and two *Rhododendron*.
- Several trees that have significant size and presence, such as the *Ginkgo biloba* at 63 Hamilton Road and three *Ulmus procera* 'Louis van Houtte' at 9, 17 Coleridge Street and 30A Hamilton Road fell just short of the 120 points threshold. One large pin oak (*Quercus palustris*), at 21 McClinton Street, Pirongia, with good Condition Evaluation points scored just 102 points overall, which is attributed to this tree scoring lowly in the Amenity Evaluation criteria under 'Visibility', 'Role' and 'Climate'.
- Native trees that scored less than 120 points include one kowhai (*Sophora tetraptera*), one rimu (*Dacrydium cuppressinum*) and one silver beech (*Nothofagus menziesii*). The kowhai and beech, both at 65 Princes Street have been found to be in poor condition and amongst many other trees. The rimu is poorly sited on the boundary between two residential properties at 34-36 Queen Street, so scores lowly in 'Role' and 'Function' criteria.

2.3 Trees that scored highly include large and prominent specimens, such as:

- Coast redwood (*Sequoia sempervirens*), elm (*Ulmus procera*) and black walnut (*Juglans nigra*) growing at the elevated site at 91 Coleridge Street,
- English oak (*Quercus robur*) at 567 Beechey Street, Pirongia,
- Deodar cedar (*Cedrus deodara*) at 57 Shakespeare Street, Leamington,
- Scarlet oak (*Quercus coccinea*) at 59 Bowen Street,
- Black walnut (*Juglans nigra*) at 3/1215 Kaipaki Road.

3 RECOMMENDATIONS

3.1 It is recommended that further testing, moderation and/or peer review of the STEM threshold and my scoring should be carried out by another independent consultant arborist and/or historian. This is due to the subjectivity inherent in tree evaluation and the potential for relevant Notable Evaluation section criteria that I am not aware of.

APPENDIX A – STEM ASSESSMENT SCORE SUMMARY

Comments

Form	Single, upright trunk. Irregular crown
Occurrence	Not commonly seen in District
Vigour and Vitality	Some decline in canopy
Function	No particular function
Age	Estimate
Stature	16.2 tall
Visibility	Screened by buildings
Proximity	Single tree on site
Role	Well positioned in courtyard
Climate	Shade to impermeable surfaces

Comments

Form	Single trunk, slightly crowded multi-stemmed unions. Balanced crown
Occurrence	Few others observed in District
Vigour and Vitality	No apparent faults
Function	Walnuts, wood properties
Age	Estimate
Stature	34.5 cs dia. 32.9 tall
Visibility	Wide view in rural area
Proximity	Many other trees on site
Role	Well positioned relative to dwelling, lawn and open space
Climate	Shade to large area of lawn

Comments

Form	Single trunk with co-dominant stems. Balanced, slightly off-centre crown
Occurrence	Frequent
Vigour and Vitality	No apparent faults
Function	No particular function
Age	Planted around 1922, pers comm.
Stature	13.3, 11.5 csr, 22.8 cs dia. 20.8 tall.
Visibility	Town edge
Proximity	Garden contains several other specimens
Role	Well placed in front lawn, complements dwelling
Climate	Shade to footpath and road

Comments

Form	Single trunk, low-branching. Good framework of branches, mostly balanced crown
Occurrence	Several observed in District
Vigour and Vitality	No apparent faults
Function	Wood properties
Age	50 odd years old, pers comm
Stature	26.6 tall
Visibility	Tall tree with low level dwellings on flat land
Proximity	Many other trees on site
Role	Not important to setting
Climate	Shade and shelter to several dwellings and driveway
